

Complete-cycle boundary-control amplitudes

Measured 102–112 s on the common research replay clock; no amplitude rescaling

Input/control	Cd raw	Cd drift	Cl raw	Cl drift	Cd/Cl cycles
Reference flow	0.053701	0.053699	1.078737	1.078404	3/1
Exact reference traces	0.052400	0.052221	1.057401	1.054364	3/1
Reference harmonics	0.052539	0.052273	1.072816	1.070331	3/1
Actual VPM harmonics	0.039347	0.038578	0.970176	0.954368	2/1
Reference mean · actual oscillation	0.033905	0.032918	0.902104	0.858965	2/1
Actual mean · reference oscillation	0.059419	0.058517	1.233346	1.207189	3/1
Actual VPM harmonics · full velocity	0.039458	0.038639	0.972147	0.951034	2/1
Reference Un oscillation · actual Gt	0.059397	0.058470	1.226567	1.201247	3/1
Reference Gt oscillation · actual Un	0.039372	0.038606	0.975474	0.960773	2/1
Cold image · reference support	0.053194	0.051858	0.989952	0.980986	3/1
Cold image · production support	0.041356	0.040730	0.988833	0.968667	3/1

Each cycle is wholly bracketed by troughs inside the measured window. Pressure/viscous contributions and transient trends are in the JSON report.

Forced boundary-input controls do not demonstrate a self-sustained production repair. Retired warm-image experiments are excluded.
