

Planar cylinder force deficit remains in developed shedding

Same physical-time window 55–85 s: coupled Cd amplitude 64.0% and CI 78.6% of reference

Complete cycles: Cd 10 coupled / 10 reference; CI 4 / 5. Raw force data are preserved.

Cd median raw: 0.034119 / 0.053347

Drift corrected ratio: 0.6390

CI median raw: 0.845974 / 1.076288

Drift corrected ratio: 0.7859

Complete cycles require a peak between two troughs wholly within the common window. No phase or amplitude rescaling.

This production comparison establishes the persistent deficit; boundary-input causality is assessed by separate forced controls.
